

Facial Processing Study

The Yonas Visual Perception Lab at the University of Minnesota is currently looking to recruit children with high functioning autism or asperger's syndrome to participate in a research study focusing on facial recognition and processing.

The purpose of this study is to gather data on this subgroup of children to see how their facial processing methods are similar or different to typically developing children and/or children with prosopagnosia (face blindness).

Our ultimate goal is to get to the heart of how children process faces and create an intervention program for those children that struggle with this task.
